

# Nepleslian Standard Starship Medical Bay

First implemented on the [DD4-C-class Destroyer](#) destroyer, Nepleslia has generally used the same medical bay configuration in almost all of its warships. While the size of these bays is generally decided on by the size/ needs of a vessel, they all share similar features.

Inset into the door are nozzles that spray people down with a fine mist of special chemicals that cleanse them of impurities and kill bacteria, viruses, ect. The side walls of the medbay are lined with bunk beds and painted white like the rest of the medbay. Each is padded with memory foam and contains automated systems to perform first aid, defibrillation of the heart, and suspended animation functions in the event that the automated surgery tables and medical staff are overwhelmed. Small drains in the beds are capable of gathering lost blood, cleaning it, and retuning it to the patient.

The center of the room contains a number of tables, each with a spider like machine above them that has a variety of arms filled with drug dispensers, flesh fabricators, and other implements of surgery. These robots are capable of performing complex surgery on a patient quickly and efficiently without help from the medical staff. Like the beds on the side walls these tables are capable of blood transfusions and collecting blood lost, cleaning it, and returning it to a patient. Below these tables are cabinets with various pieces of medical equipment for the medical staff to use.

The rear wall contains a diagnosis area. Using inbuilt sensors any patient can be scanned and their vitals displayed upon the flat white wall. Tox screens and brain chemistry checks can also be preformed through the stations located on this wall. Additional equipment storage is built flush against the wall and is opened by a verbal command given to the ship's computer by the medical staff. NOTE: The high resolution screen is for Serious Business not for watching AetherSperm music videos when the XO is not around.

The ceiling contains high powered lights that operate in a variety of spectrums for all conditions as well as four deployable, spherical, bots that float in the air. These bots use magnetic grappling technology to levitate and bring equipment from the storage areas to the medical staff that makes a request for additional equipment. Several hemispherical bots levitate small equipment trays that are 2x4 feet in size beside the medical staff to hold equipment for them.

When not in use the computer will automatically seal the medbay and sterilize the entire room with hot water sprayed from the floor, cleaning chemicals, and microwave radiation. Water drains out through a drain in the floor when the cleaning process is completed.
