

# Neshaten Flight Control Center

Found on stations and carriers, the [Neshaten](#) Flight Control Center is the nerve center of any large fighter or shuttle operations. The center is one of the largest on a ship, and could be split between various sections depending on the size and nature of a ship or station.

Typically the control center is two stories tall, with nothing but flight control stations to help guide traffic in the area. These stations can handle anything from small shuttles, to massive transports. During emergencies, more than one station might be tasked to handle the situation.

## Details

The room is circular with terminals up against the walls; the center is typically manned by two medium ranked officers. There is a movable robotic chair in the center of this room that the supervisor sits in and can move around freely. In Zero-G, the chair can be disconnected from the robotic arms and is instead moved around by using small puffs of air.

The floor is a metallic grated mesh that can be walked upon while in gravity, there are stairs on the walls that are recessed into the walls when the ship is in zero-g, but are out in the open when in gravity to give crewmen the ability to get to their stations.

There is a single door into the room that is located on the western side, which gives a clear path to the central stations.
