Year Created:	<a href="#">YE 45</a>
Designer / Manufacturer:	<a href="#">Advancer Enterprises</a>
Nomenclature:	AE-N16
Price:	20 KS per 100mg capsule

## History

Metabovin was conceived as a part of Advancer Enterprises' broader initiative to combat metabolic disorders and improve overall health. The project was spearheaded by Dr. Emily Thompson, an endocrinologist at Advancer. The drug was developed to fill a gap in the market for medications that could optimize metabolic pathways in a comprehensive manner, rather than merely treating individual symptoms or disorders.

The development process involved rigorous pre-clinical trials, including both in vitro and in vivo studies, to evaluate its efficacy in regulating metabolic functions. These trials were successful, leading to accelerated human clinical trials. By late [YE 45](#), Metabovin had received approval for mass production and was incorporated into Advancer's pharmaceutical catalog.

## Usage

Metabovin operates by stimulating various metabolic pathways, including those involved in energy production, nutrient absorption, and waste elimination. The standard dosage is a 100mg capsule, administered orally once daily. The drug is particularly effective in optimizing the breakdown of carbohydrates, proteins, and fats, thereby increasing energy levels and promoting weight loss. It is beneficial for individuals suffering from metabolic disorders such as metabolic syndrome, obesity, diabetes, and conditions involving malabsorption.

Given its potent effects, Metabovin is also being researched for its potential use in athletic performance enhancement and in conditions involving chronic fatigue. However, these are considered off-label uses and should only be pursued under medical supervision.

## Side Effects

While Metabovin is generally well-tolerated, it does come with a set of potential side effects. These

include gastrointestinal discomfort, increased urination, changes in appetite, and in some cases, palpitations. The body's adjustment to a higher metabolic rate might result in feelings of restlessness, insomnia, or increased sweating. Given its potent effects on metabolic rates, Metabovin should be used cautiously in individuals with pre-existing liver or kidney conditions. Regular monitoring by a healthcare professional is strongly recommended.

## Overdose

Excessive consumption of Metabovin poses a risk of severe metabolic imbalances. Symptoms may include extreme gastrointestinal distress, acute kidney failure, and potentially fatal liver toxicity. The overdose threshold is estimated to be between 500mg and 1000mg, depending on individual metabolic rates and pre-existing health conditions. Immediate medical intervention is crucial, often requiring detoxification procedures and supportive care to stabilize metabolic functions.
