

Bjornskald Rounds

Ammo designed by [Egwene Tai](#) for use in the Bjornskald Coilgun. It was, obviously, made by the same person at the same time as the Bjornskald.

Stats

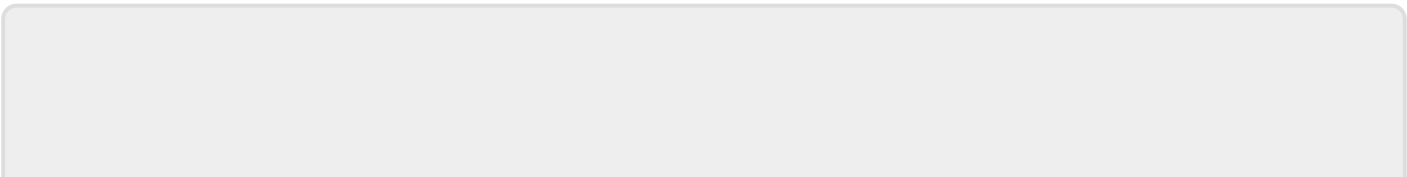

The ammo is a relatively small dart designed far more for surviving the thermal impact of it's velocity than density, as the speed at which it travels deals the majority of the damage anyway.

- Damage Rating: Tier 7 ([Light Anti-Mecha](#))
- Size: 30cm
- Caliber: N/A (Dart)
- Damage Description: Fired in one of two phases, each with differing impact capabilities.
 - Upon manned armour, the dart vaporises on impact from the kinetic force and imparts a superheated pressure wave into the crew compartment to turn them into burned hamburgers. This phase does surprisingly little damage to the machine itself.
 - The second phase is for unmanned armour. This dart fires at a lower velocity to ensure that it transfers far more energy into the structure of the thing than the first phase's dart, causing massive structural damage to the target area, tearing a large hole and melting the internal components.
- Effective Range: 4km in atmosphere (Though tends to tumble off target after 1km), effectively unlimited in space.
- Muzzle Velocity: (Phase one) 3430m/s (Phase two) 2058 m/s
- Muzzle Blast: Moderate atmospheric shockwave
- Recoil: Medium-Heavy, continuous push.
- Energy Source: Electromagnetic.
