The HEAAP round

The HEAAP round, or High Energy Anti Armor Plasma round, was developed in YE 40 by Osman Heavy Industries. The technology does not refer to a single round but instead to a round type.

About the HEAAP type round

HEAAP type rounds are gyrojets, meaning that they use rockets for propulsion rather than gas propulsion from inside the chamber of a weapon. The rounds can also work with rail and coilguns, since it is made out of a ferromagnetic material. Upon impact, a HEAAP round projects the plasma inside it like a jet, made to carve through armor.

A HEAAP round's damage output varies somewhat based upon the velocity from which it is launched from a weapon, as well as the caliber, size and the amount of plasma generated upon impact.

HEAAP type rounds are scaled up in all dimensions, keeping their design uniform if larger as the caliber increases.

Stats

The size, caliber and damage of HEAAP rounds can vary, as can their muzzle velocity, which at its lowest is 2 km/s.

- Damage Rating: Tiers 5-9 depending on caliber
- Size: VariableCaliber: Variable
- Damage Description: After impact, a tungsten slug is melted into plasma by an electric charge provided by a capacitor within the microjet. The plasma expands and causes the round to explode.
- Effective Range: Variable.
- Muzzle Velocity: Depends on caliber and application. Without gauss or railgun assistance, the
 slowest of the rounds travel at 2 KM/s in the atmosphere after exiting the muzzle. However, the
 round increases in speed over time as the rocket engine propels it, making this ammunition type
 great for long-range engagements, as this majorly offsets the time it takes for a round to travel
 extremely long distances.
- Muzzle Blast: A fwoosh as the rocket ignites and propels the microjet
- Recoil: Negligible, because of the nature of the propulsion system.
- Energy Source: Miniature plasma rocket, and electromagnetic propulsion depending on application.
