

# Starkwerk Station Control Module

A module for civilian space stations that was put into production beginning in [YE 33](#)

## About the Module

The Starkwerk Station Control Module is the nerve center for operations within the station. Communications both within and without go through this Module's systems. The orientation controls for stations in orbit also reside here, as well as sensors and the like. It was designed and produced by [Dietrich Starkwerk](#) beginning in [YE 33](#).

- Price: 20,000 KS

# Systems

## Communications

[station\\_laser\\_communication](#) [radio](#) [station\\_subspace](#)

## Sensors

[civilian\\_subspace\\_mass](#) [civilian\\_radar](#)

## Damage Control

There are four points from which fire extinguishing equipment can be found. One by each Airlock, and one next to the command chair in the Control module. [standard\\_airlock](#) Six. At each end of the corridors (tubes seen jutting out of the module.) They're designed as both entrypoints and as damage-control measures. When the pressure drops below one standard Atmosphere (or a programmed amount) the airlocks will seal until overridden. As well, when certain circuits are broken in the corridor and with the modules they're connected to, they will seal up again to prevent decompression in other parts of the station.

## Hull

[Standard Civilian Hull](#)

## Internal Appearance

The Control Module comes pre-built with three corridors. Each of these 'tubes' has a main walkway for when gravity is active, and has handrails for when gravity is inactive. Inside the control module is a singular room divided into three sections. Communications, Sensors, and Control. Communications has a singular seat and bank of two monitors, and is meant to handle the communications of the station - both inside and out. Sensors has two seats, each one capable of viewing the four monitors of their own bank - two monitors are dedicated to internal views of the station, and the other two for sensors' readouts. If the station came with defenses, Sensors is also where they are controlled. The Control section has one seat for the 'commander' or leader of the station. From the [starkwerk\\_touchcomputer](#) built into the chair (it juts out from the arm to hang on a small platform) he can control airlock access, power, and other pertinent things including cargo manifests and communications filters. From this device he can also manually take control from the other sections in the module. These sections can also forward pertinent information.
