Norjopa Yoqa'te (Machine Connecting)

This page provides information regarding how the Poku Saeruo Degonjo link their computer technology. These are for systems on board their facilities and ships. It does not include data transfers via the ships secure communications system.

Femymaqi Ibâ (Light Wire)

This the primary method used for linking data systems. They use fiber optic transfer systems because of their secure nature, leaving no EM signals to be intercepted.

Femymaqi Oq (No Wire)

This is the secondary method used for linking data systems. It is the Poku'vonai wireless networking technology. Use of the Femymaqi Oq requires a secure connection. Many Poku'vonai devices are wireless capable. All vessels that leave Degonjo Saeruo (Hidden Sun System) disable all Femymaqi Oq systems until they are back.
