

Yamashuto Science Lab

Equiped to handle data retrival and sensor data from the ships sensor array; the lab is split into only two smaller labs, each assigned to a unique task:

- Planetary - this lab has equipment for studying the biology, botany, geology, meteorology of a world.
- Stellar - this lab has equipment for performing detailed analysis of the objects in a system, such as moons and planets.

The center lab helps augment the two smaller and has a holographic tank that displays the planet of choosing for colonizing. The science lab works in conjunction with the colonization bridge, to determine a good location for setting down the initial colony. It also monitors seismic activity and weather patterns and also serves as the temporary 'weather control station' during a colony's initial startup phase.

It is manned by a single officer and sixteen enlisted, all split between the three section.
