

Gravimetric Drive

Gravimetric drives are basically [continuum distortion drives](#) used for slower-than-light travel.

Gravimetric drives...

- are projected from shield-like panels or large hull surfaces like CDD/CFS
- do not need rocket nozzles
- require energy but no fuel
- can be used for any STL speed
- are subject to [Anti-FTL fields](#)
- like CDD drives, produce no inertia
- ideal for use during landing and launching with no risk to people or equipment

Admin Note

I would like to see these drives phased out over the next two years by replacing them with CDD/CFS and/or other drive systems like ion, plasma, etc.
